

CropScan Logistics Software

The CropScan 3300H On Combine Analyser has a unique software option called CropScan Logistics. As grain is harvested, the Logistics Software provides a means of managing the quantity and quality of grain directly from the combine.

A Virtual Farm Storage System is set up on the CropScan 3300H Touch Screen PC showing the field bins, carts, chaser bins, trucks, silo, sheds, bags and bunkers where grain can be held and stored. The running average for Protein, Moisture, Oil and Starch are recorded for each storage system. As grain is loaded into and out of the storage system the running averages are updated. The load weight can be recorded from the Yield Monitor or from an Agrimatics Grain Cart Weighing System.

The CropScan Logistics Software can run from several tablet PCs that are synchronised in the field. The farmer or farm manager can be directing how much and where each tank of grain is to be stored, blended and shipped. The data can be sent to the Cloud and viewed remotely from a Smart Phone, Tablet or PC.
